MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Run on: Thu Dec 16 13:25:14 1999; MasPar time 9.63 Seconds 816.384 Million cell updates/sec

Tabular output not generated.

Description: Perfect Score: Sequence:

>US3869-29-38183 (1-278) from us3869-29-38183.pep 2088 1 MDIDPYKEFGATVELLSFLP......RRRRSQSPRRRRSQSRESQC 278

Scoring table: PAM 150 Gap 11

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 48.215; Variance 102.691; scale 0.470

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Thu Dec 16 13:26:11 1999; MasPar time 19.81 Seconds 765.940 Million cell updates/sec

Title:

Description: Perfect Score: Sequence: >US3869-29-38183 (1-278) from us3869-29-38183.pep

Scoring table: PAM 150 Gap 11

Searched: 179066 seqs, 54579741 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: sptrembl9

1:sp_archea 2:sp_bacteria 3:sp_fungi 4:sp_human 5:sp_invertebrate 6:sp_mammal 7:sp_mhc 8:sp_organelle 9:sp_phage 10:sp_plant 11:sp_rodent 12:sp_unclassified 13:sp_vertebrate 14:sp_virus

Statistics: Mean 46.475; Variance 103.566; scale 0.449

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Statistics: Mean 33.363; Variance 173.459; scale 0.192

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                         PT DNA encoding proteins which can be incorporated with wild type protein shibition of viral replication, especially hepatitis B virus PT inhibition of viral replication, especially hepatitis B virus PS Claim 15; Page 35; 60pp; English.

CC This polypeptide comprises the hepatitis B virus (HBV) 25 kDa (p25) PS Claim 15; Page 35; 60pp; English.

CC This polypeptide comprises the hepatitis B virus (HBV) 25 kDa (p25) Protein that is encoded by the full-length HBV precore gene. Evidence is provided that HBV replication is inhibited in the protein scan be incorporated into HBV nucleocapsids along vith the p21 core protein see W50251), which is the usual nucleocapsid component, and thereby render the nucleocapsids deficient in encapsidating HBV pregenomic RNA. Thus, overexpression of the precore proteins, or certain variants of them, cleads to transdominant inhibition of HBV replication. Suitable inhibitory proteins include p25, p22 (see W50241), Met-p22 (see W50242), p18 (see W50236), Met-p18 (see W50237) and Met-p18 (Het (see W50238)). The inhibitory proteins can be produced by recombinant methods using claimed expression vectors and host cells. They can be provided exogenously to the target cells for construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.

Alternatively, a nucleic acid construct that directs overexpression of an inhibitory protein in target cells is used for the gene therapy of HBV infection.

PS Disclosure; Fig 13; 456pp; English.

CC The sequence given is encoded by an expression cassette which comprises a portion of the hepatitis B virus (HBV) pre-S region (S12/CC core) which is precisely linked to the I3L promoter derived from CC vaccinia virus. This DNA sequence was linked to the S1 and S2 vaccinia virus. This DNA sequence was linked to the S1 and S2 recombinant expressing the HBV gene. Other HBV genes were also used in the construction of a NYVAC (Sepandam of the construction of the sequence was linked to the S1 and S2 vaccinia virus which has been modified by deletion of these gene CC vaccinia virus which has been modified by deletion of six non-essential regions of the genome encoding known or potential virulence factors. The deletion loci were engineered as recipient loci for the insertion of the three inserted sequences engineered inserted sequences ensured that any recombination that did occur would lead to disruption of the conscinia genome and would cause unviable vaccinia virus.
